

CONTENDER SAILCLOTH®

HOLMENKOL Aquatics Line

Contender Sailcloth, Fall River, MA is pleased to announce an exclusive distribution in the United States and Canada with Holmenkol products for their aquatics line of advanced coatings.

Holmenkol has been a leading developer in racing ski waxes and waterproofing since 1922, and has recently branched out into the marine market with their Aquatics line geared at improving the performance of all types of boats.

The Holmenkol line consists of five basic products designed to improve performance and maintenance on both sail and power boats, racers and cruisers. The products are:

SportPolish: State of the art cleaner and sealer for gel coats, carbons and metals. Reduces maintenance on all surfaces, resisting abrasion and dirt. Prepares all underwater appendages for the application of Aqua Speed

AquaSpeed: Creates a low friction surface on all underwater surfaces. Using Nano technology, this advanced coating has proven to reduce surface resistance up to 45%. Ideal for dry sailed boats and dinghies.

SealNGlide: Two part concentrate designed for spinnakers and sails. Improves porosity, tear strength, and water absorption. Easy to apply, and resists abrasion. Reduces friction while hoisting and jibing.

LubenSpeed: High tech lubrication for blocks, hardware, and tracks. Resists dirt and salt, as well as repels water on moving parts. Nano technology creates "Intelligent surface" to reduce friction beyond traditional lubricants.

NoFog: Anti fogging coating and cleaner. Reduces fogging and salt build up on all types of glass and hatches.

All of these products will be distributed by Contender Sailcloth, and available through your local sail-maker and marine chandlery. Questions please contact:

NANOTECHNOLOGY

Nanotechnology will be the leading technology of the 21st century. Intelligent, self-organizing, ultra-thin coatings are being developed for a wide range of functional applications.

The Holmenkol Aquatic Line is a range of polishes and coatings using nano-chemistry to alter the surfaces of hulls, sails, and deck hardware. These "intelligent" surfaces reduce friction, water absorption, and provide a durable protection against weathering and dirt.
